TEAM DOCUMENT

VidhyaSaathy

Your school, online, after the bell rings.

A one-read guide to the idea, the workflows, the open decisions and the team workspace.

Team draft v1 | 13 October 2026 | Vikrant University Junior Hackathon 2026

The name is not final. The team mockup is titled ClassOS. The idea matters more than the name.

Contents

1. The idea in one minute
2. The problem we are solving
3. Where the idea came from
4. Who uses it and what they do
5. How a school joins
6. The student experience
7. The teacher experience
8. Personalised study plans
9. Games and formats
10. The parent view
11. A day in Class 9-A
12. Problems we still must solve
13. The team mockup and tech ideas
14. Decisions before we build
15. Team workspace

> **How to read this:** Items marked **CONFIRMED** are part of the idea as the founder described it. Items marked **PROPOSED** are suggestions to discuss. Items marked **OPEN** are not decided.

1. The idea in one minute

> **VidhyaSaathy is an online copy of each school class.** Whatever happens in the offline class (notes, homework, tests, lesson recordings) also appears online in that class's workspace, so the school keeps helping the student at home.

- **One workspace per class**, for example Class 9-A. Students, teachers and parents are connected to it.
- **The teacher leads the class.** Teachers publish notes, homework, recordings and self-study sessions.
- **Self-study sessions are fixed.** The school makes them. The teacher decides the day they open.
- **An AI helper** answers questions and builds a study plan that points to the right school note, recording or video.
- **Parents see what the child is studying** and what is done, not every private conversation.

The core loop

Teacher teaches	Notes and session published	Student studies and practises	Quiz / check	AI suggests next step	Teacher sees class gaps

Then the loop repeats the next day, with the teacher's next class.

The one-line thesis

> **Why should the school's support end when the bell rings?**

2. The problem we are solving

The problem is not that learning material is missing. The problem is that there is too much of it, and no path that says what to do next.

Problem	What it looks like for a student	Status
Too many sources	YouTube, PDFs, friends' notes, AI tools, coaching notes. Different versions, no way to know which matches the school syllabus.	Founder observation
No clear direction	"Okay, I have to study Physics tonight. What do I even do?"	Founder observation
No check of understanding	An hour of study does not show whether the concept was understood.	Founder observation
Missed lessons	A missed class or a weak prerequisite creates gaps that grow later.	Reasoned, needs testing
Coaching gap	Students with coaching get a second structure. Students without it manage alone.	Hypothesis, needs research
Repetitive writing	Much class time goes to copying notes from the board, for students and teachers.	Founder observation
Parents in the dark	Parents see marks, not what the child studies or where they are stuck.	Hypothesis, needs research
Distraction	Students open many slides at once, switch apps, or skip the test.	Founder observation

Note: these are the founder's observations and hypotheses. They are not yet backed by surveys or published research. Validation is listed in Section 14.

3. Where the idea came from

The founder was a strong student, scoring above 90% in earlier classes. In Class 9, studying became chaotic. There was no coaching, so when a topic like Biology or Physics was hard, the founder searched YouTube, asked friends for notes, and used AI tools. Friends' "perfect notes" were all different, and the founder had to decide what to trust.

> **Lesson from this:** the problem was not that nothing was available. It was that nothing came together into one coherent path. This is one student's experience, not proof that every student faces the same problem.

4. Who uses it and what they do

Role	How they join	What they do	What they see
Student	Roll no. or admission no., class, section (+ verification, OPEN)	Read notes, do self-study, homework and quizzes, ask the AI helper	Own class workspace, own study plan, own progress
Teacher	Staff ID, assigned classes and subjects	Publish notes, create and time sessions, set homework and quizzes, share recordings	Class completion, concepts many students miss
Class teacher	Teacher with extra rights for one class	Manages the class workspace and shares class updates	Whole class view
Parent	Linked to a verified child	Follows progress and tasks	Own child only. Not private AI chats
School admin	School account	Creates classes, sections, teacher assignments and enrolments	School-wide structure, not student ranking

5. How a school joins

1. School is registered on VidhyaSaathy.
2. Classes and sections are created (for example 9-A and 9-B).
3. Teachers are assigned to their subject and class.
4. Students are added to their class.
5. Parents are linked to their verified child.
6. Syllabus, chapters and notes are organised by subject.
7. Each class workspace goes live. Notes from day one can be published.

> **OPEN:** Who adds the student list? The school admin uploads it, the class teacher adds students, or students self-join with a code. Login needs more than a roll number, because a roll number alone is not secure. Options: school-issued activation code, verified parent phone, or admin approval.

6. The student experience

The student opens the app and sees one question answered: **what do I study now, and what do I do after?**

Feature	What it does	Status
Notes from day one	Teacher publishes notes topic by topic as the chapter is taught.	CONFIRMED
Online homework	Exercise is solved in the app, not copied into a notebook.	CONFIRMED
Self-study session	Fixed set of slides, one small topic per slide. Teacher picks the day it opens.	CONFIRMED
Classroom recording	Teacher's lesson uploaded so the student can replay the topic.	CONFIRMED (if school allows)
Class space	Students and teachers of the same class are visible together in one group.	CONFIRMED
Ask-me-anything AI	Answers questions in the context of the subject and class.	CONFIRMED
AI study plan	Student says what is hard. The AI builds steps and points to resources.	CONFIRMED
Suggested videos	Plan can point to a YouTube video or a classroom recording.	CONFIRMED
Quiz after session	Teacher's quiz checks what the student understood.	CONFIRMED

Example: a self-study session

> **Self-Study Session 3, Physics, Motion (fictional example)**
> 1. Learning goal: understand distance and displacement.
> 2. Slide 1: definition, one idea only. Slide 2: diagram. Slide 3: worked example.
> 3. Classroom recording for the same topic (optional).
> 4. Five short MCQs.
> 5. Recap and "next step": Speed and Velocity.

Example: AI study plan

Student says: "*I am not able to understand Coordinate Geometry.*" The plan (proposed) could look like this:

- Step 1: Revise the coordinate basics note from school.
- Step 2: Watch the 6-minute classroom recording segment on plotting points.
- Step 3: Study one worked example.
- Step 4: Solve 3 easy questions.
- Step 5: Take a 5-question mini-check.
- Step 6: Move to application questions if the check is good.

7. The teacher experience

- **Less copying.** Notes are published once and reused each year. Students do not spend class time copying.
- **Sessions are reusable.** Teacher can change questions per class. The session structure stays fixed.
- **Timed release.** "Complete Self-Study Session 3 tonight." The session opens on the chosen day.
- **Quiz as a check.** Teacher sees who completed the work and who did not.
- **Class-level view.** Teacher sees which concept many students missed (for example Acceleration).

> **Principle:** one teaching effort, many uses. Notes + recording + session + quiz from the same lesson. Teachers stay in control of content and assessment.

8. Personalised study plans

The AI does not just answer. It asks what the student needs next, based on the class work and the student's results.

Four internal performance bands (PROPOSED)

Band	Internal meaning (never shown as a label)	Possible support
0 to 25%	Large gaps	Simpler explanation, prerequisite revision
25 to 50%	Basics partly clear	Worked examples, guided practice
50 to 75%	Basics clear	Application questions, more practice
75 to 100%	Consistent understanding	Next concept, harder challenges

> **Team caution:** students must not be called weak, average or smart. A single overall percentage hides which concept is weak. Tracking per concept is probably better, and the thresholds are not validated. **OPEN.**

Different ways to learn (PROPOSED)

Some students learn by practising, some by listening, some by visuals, and some by games. VidhyaSaathy can offer all of these for the same topic. It should not lock a student into one "learning style", because strong evidence for fixed learning styles does not exist.

9. Games and formats

Lightweight games tied to the chapter. Illustrative list, not final. The founder's idea is 4 to 5 games that change slightly for each chapter.

Game format	How it works	Helps with
Timed concept challenge	Answer quick questions before the timer ends	Recall of definitions
MCQ rush	Chapter MCQs with streaks	Practice and speed
Match the concept	Match terms to definitions or formulas	Vocabulary and formulas
Quick revision quiz	Five random questions from the chapter	Revision before a test
Chapter progress challenge	Unlock the next level after mastering a concept	Sequential progress

Rule: games must reward understanding and correct practice, not just time spent on screen.

10. The parent view

Parents CAN see	Parents CANNOT see (by default)
Subjects and current chapter	Private conversations with the AI helper
Homework and tasks done / pending	Full learning history of other students
Self-study session completed or not	Anything about other children
Quiz results for their own child	Public rankings
Areas needing extra practice	
Teacher updates for the class	

> **Goal:** parents know what the child is studying, so the child is not lost in "YouTube chaos" at home. Parents do not become the child's teacher. **OPEN:** how often parents receive updates.

11. A day in Class 9-A

All students, scores and times below are fictional, to show the workflow.

When	Who	What happens in VidhyaSaathy
10:00, school	Teacher	Teaches Motion. Lesson recording is uploaded to the class workspace.
14:00	Teacher	Publishes notes on Motion. Sets Self-Study Session 3 to open at 18:00 tonight.
18:30	Student A	Completes the session. Quiz score 5/5. Gets a harder speed and velocity problem set.
18:30	Student B	Quiz score 2/5, struggles with Acceleration. Gets a simpler explanation, worked examples and 3 practice questions.
18:30	Student C	Missed the class. Catches up with the notes, the recording, and the session.
Next morning	Teacher	Sees that most of the class is stuck on Acceleration. Spends 10 minutes reteaching it.
Evening	Parent	Sees that Session 3 is done, the quiz score, and the next step.

12. Problems we still must solve

These problems were raised by the founder. The ideas on the right are first thoughts to test, not decisions.

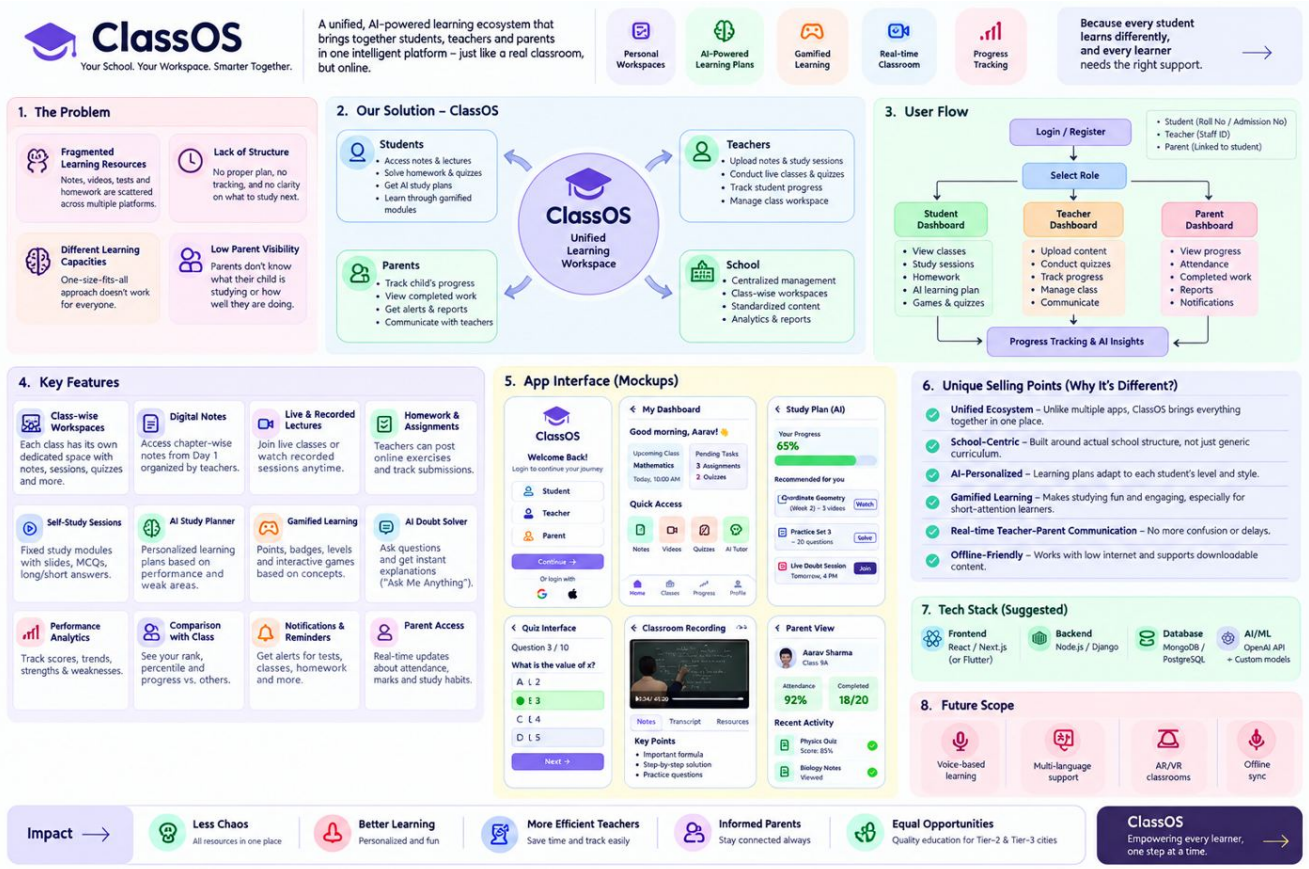

Problem	Why it matters	First idea (PROPOSED)
Student opens all slides at once	Looks like progress, but nothing is learned	Slides unlock one after another. Each topic ends with one question.
Student skips the test	No evidence of understanding	Session is complete only after its check. Teacher sets this rule.
Student closes the app	Work is left half done	Short sessions, saved progress, gentle reminders.
Distraction from other apps	Study time becomes YouTube time	Session mode with progress bar. Clear next step on exit.
Teacher workload	Teachers will not use a complicated tool	Reuse last year's notes. Publishing in a few clicks.
AI gives wrong answers	Wrong explanations hurt students	AI answers only from teacher material and shows the source. Teacher review.
Child privacy	Records of minors	Verified login, parent sees only own child, minimal data.

Problem	Why it matters	First idea (PROPOSED)
Shared phones, weak internet	Many students may not have a private device	Mobile-first, light pages, compressed resources. Offline is a later idea.

> **Key point:** opening a slide or spending time in the app is not learning. Each session should end with a check of understanding.

13. The team mockup and tech ideas

The team's mockup (titled ClassOS) shows a possible look: role-based login, student dashboard, AI study plan, quiz, classroom recording and parent view. These are concepts, not built screens.

Team mockup. Labels and layout are for discussion.

Suggested stack (PROPOSED, not decided)

Layer	Options from the mockup	Note
Frontend	React / Next.js, or Flutter	Mobile-first matters for students
Backend	Node.js or Django	Pick what the team knows best
Database	MongoDB or PostgreSQL	Relational fits classes, sessions and progress
AI	OpenAI API with custom context	Answers grounded in school material

Future ideas from the mockup (not in scope now): voice-based learning, multi-language support, AR/VR classrooms, offline sync.

14. Decisions before we build

Leave these open until the team agrees. Do not guess.

#	Decision	Options	Current thinking	Status
1	Product name	VidhyaSaathy, ClassOS, other	Idea matters more than name	OPEN
2	Student login and verification	Activation code, parent phone, admin approval	Not roll number alone	OPEN
3	Who adds students?	Admin upload, class teacher, self-join		OPEN
4	Min. evidence before a prerequisite gap is suggested	Question count, question types		OPEN
5	Band thresholds vs per-concept tracking	Overall %, per-concept, dynamic	Per-concept probably better	OPEN
6	Class insights show names or only counts?	Names, counts only		OPEN
7	How parents get updates	Daily, weekly, on event		OPEN
8	How a session becomes complete	Slides viewed, quiz passed, both	Quiz or check must be included	PROPOSED
9	Target school for first pilot	Own school, partner school, other		OPEN

15. Team workspace

Use this section during team meetings. Ideas here are not approved features until the team marks them approved.

A. Ideas and features

#	Idea	Problem it solves	Who (S/T/P/ School)	Priority	Status	Notes

Priority: High / Medium / Low / Undecided. Status: New / To discuss / Approved / Rejected / In development / Done.

B. Questions and pending decisions

#	Question or decision	Options	What we think	Owner	Status

C. Team notes, feedback and changes

Date	Feedback, improvement or idea to revisit	Change to the vision? Who agreed?

Before the next meeting: each member writes one thing they would change about the idea, and one thing they think is missing. Bring them to the next call.
